

## Management statement

**SUBJECT:** Quality Health Security & Environment policy

In a very competitive global environment and in the very demanding profession of Marine safety requirements, our mission must consist in proposing the best of designed rescue equipment manufactured with awareness for the protection of the environment.

**Therefore, we must listen to our customers** so that we can develop rafts and integrated evacuation systems which are in accordance with the current market needs and that conforms to all legal and other applicable regulations. We also have to manufacture our products to the highest quality criteria whilst protecting the environment and the security of the goods and people's lives.

Our quality policy and HSE management statement is based on three priority axes:

- 1) Designing new competitive products with high added value reducing our environmental impact at the same time (for example life cycle optimization) and being compliant with the regulation.**
- 2) Increasing our base of installed liferafts and M.E.S, proposing more global solutions and developing our aftersales department by building on the continuous improvement of our processes.**
- 3) Proposing competitive and high-quality products in a suitable delivery time for the customer by improving the conditions at work and keeping and developing our internal and external skills.**

**All the processes are involved in this approach.**

Consequently, I engage myself to give all the necessary means to implement the quality policy, to deploy objectives and continuous improvement of the quality, safety and environment system according to ISO 9001 and 14000 standards. I also engage myself to promote, animate and develop this policy in an efficient way in our site and ask to all the staff to be daily involved in this research.
